RUMEX

From cash cow to cash flock:
Expand your milky way!

RUMEX is a 100% phytogetic product line for enhancing efficiency in ruminant production.

With **RUMEX** you trust in innovative solutions, proven to upgrade performance in a natural way.

performing nature

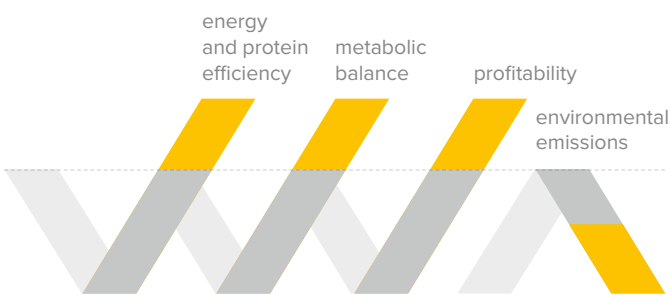

A small step for a cow, a giant leap for ruminant production.

In dairy cows, optimized husbandry and feeding conditions contribute to a profitable production. Next to diseases and animal welfare issues, losses in performance are often attributed to low feed intake, weight loss post-partum, low lactation persistence and poor reproductive performance.

The **RUMEX** product range, all-through phytogetic, is comprised of high quality active ingredients, which are perfectly adjusted to the complex digestive and metabolic system of ruminants. Like all of our phytogetic products, the **RUMEX** line ensures a safe, effective and sustainable production without leaving residues in meat or milk.

Profitable ruminant production with **RUMEX**:

- Increases feed intake and performance
- Improves palatability of roughages
- Improves nutrient digestibility
- Decreases methane and ammonia production
- Maintains metabolic balances
- Stimulates immune system

RUMEX delivers holistic benefits

Innovative compositions of active substances, like different types of essential oils, were selected to promote the production of bacterial volatile fatty acids and to decrease the degradation rate of nonstructural carbohydrates in the rumen.

Additionally, saponins that are proven to reduce ammonia production and increase the supply of volatile fatty acids are included into the **RUMEX** line. Enzymatic activities of the ruminal bacterial flora are further improved by adding live yeast, leading to promoted digestion of starch and fiber and thus, contributing to minimize the risk of acidosis.

Our patented micro-encapsulation technique protects the active substances from degradation under thermal processes in feed production and during storage.

Thus, the volatile essential oils can unfold their maximum efficacy by being released where they are needed: in the rumen and small intestine of the animal.
